Barriers to Exclusive Breastfeeding Among Women With Gestational Diabetes Mellitus in the United States

- Secondary analysis of U.S. Infant Feeding Practices Study II
   195 pregnant women with gestational diabetes mellitus
   2815 pregnant women without gestational diabetes

## Women with gestational diabetes mellitus

- Women with gestational diabetes mellitus

   Had no significant delay in secretory activation (lactogenesis II)

   Were less likely to say breastfeeding is the best way to feed an infant

   More likely to say the fathers of their infants prefer formula feeding

   More likely to say their physicians prefer formula feeding

   Less likely to report comfortable breastfeeding in front of female friends

- Less likely to have newborn stay in their hospital room

### Adjusted odds ratio (95% CI)

1.26 (0.79, 2.01) 0.62 (0.46, 0.85) 1.74 (1.02, 2.97)

2.82 (1.17, 6.79) 0.7 (0.50, 0.98) 0.55 (0.36, 0.85)

# Difference by Race in Breastfeeding Outcomes—Why?

- Black mothers do not trust or are not informed about the benefits of breastfeeding?
  - Black women overwhelming report breastfeeding to be the healthiest and most desirable method to feed their infant
- Black women are more likely to have lower socioeconomic status which relates to higher formula use?
  - Maternal mortality differs by race despite socioeconomic status
- Structural racism?
  - When formula is supplemented, nursing documentation "infant complication" most likely for White women while "maternal request" most likely for Black women. Why?

Hemingway et al 2021

## ABM Paid Maternity Leave—Importance to Society, Breastfeeding, and Sustainable Development

- 6 months paid leave at 100% pay or cash equivalent available to all mothers regardless of income, employment, or immigration status
- Minimum of 18 weeks of fully paid leave
- Partial pay for low-wage workers is insufficient
- Leave and work arrangements should be flexible whenever possible. Longer flexible leave for parents of sick and preterm infants is essential
- Providing adequate paid leave for partners has multiple benefits
- Increasing minimum wages can help more families utilize paid leave
- Cash benefits per birth can help informal workers and undocumented mothers afford to take
- Equitable paid maternity leave must be primarily provided by governments and cannot be accomplished by employers alone

37

### Another cost in the U.S.

Annual excess deaths attributable to suboptimal breastfeeding= 3,340 (95% CI 1,886 to 4,785)

- 78% maternal due to
  - Myocardial infarction (n=986)
  - Breast cancer (n=838)
  - Diabetes (n=473)
- 22% pediatric due to
  - Sudden Infant Death Syndrome (n=492)
  - Necrotizing enterocolitis (n=190)

For every 597 women who optimally breastfeed, one maternal or child death is prevented.

Annual medical costs related to suboptimal breastfeeding= \$3.0 billion

38

What can we do?

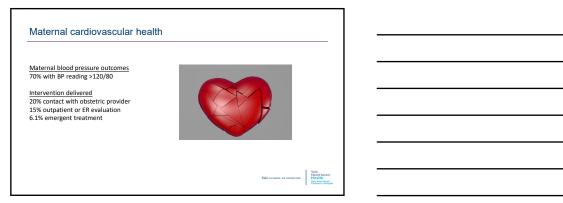

Continue the great work to invest in decreasing the "cost" for women to breastfeed, to obtain lactation support, and to obtain their own healthcare

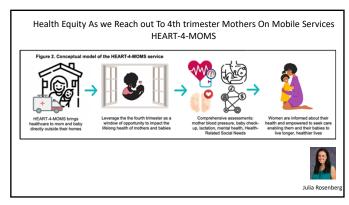

# To Facilitate Lactation Trajectory: Recognize the Need to Invest

- Breastfeeding support requires work
- Develop specialized systems for populations with lower breastfeeding rates
  - Special needs for women with diabetes
  - Anti-racism programs in lactation support
- Family leave
  - Equitable
- Women's health
- Through breastfeeding support
- Convenient

44
